

ABSTRACT

The Traffic Management System project encompasses various modules aimed at improving traffic flow and safety on roadways. The login section allows access for administrators and users, facilitating efficient management and reporting of traffic-related issues. Users can report violations and provide details such as location, time, and type of infraction, with each report generating a unique tracking ID for easy monitoring. Real-time updates ensure prompt feedback on the status of reported violations, aiding in swift resolution. Administrators have access to a control panel for managing reported violations, updating system settings, and generating insightful reports for analysis. User profiles enable individuals to track their submissions and manage personal information. Additionally, a pricing section may be incorporated for fines or penalties associated with different violations, promoting compliance with traffic regulations. Through effective utilization of these modules, the Traffic Management System facilitates efficient enforcement, enhances safety, and contributes to smoother traffic operations.
